

Section 1.5

[1] Provided $f(x) = 5x + 4$.

x	1.9	1.99	1.999	2	2.001	2.01	2.1
$f(x)$	13.5	13.95	13.995	?	14.005	14.05	14.5

From the table

$$\lim_{x \rightarrow 2} (5x + 4) = 14.$$

[10] From the graph it is clear that

$$\lim_{x \rightarrow 1} f(x) = -2$$

$$\lim_{x \rightarrow 3} f(x) = 0$$

[12] From the figure it is clear that

$$\lim_{x \rightarrow -2} h(x) = -5$$

$$\lim_{x \rightarrow 0} h(x) = -3.$$

[17] It is easy to see from the graph that

$$\lim_{x \rightarrow 3^+} f(x) = 1$$

$$\lim_{x \rightarrow 3^-} f(x) = 1.$$

Therefore the limit exists and

$$\lim_{x \rightarrow 3} f(x) = 1.$$

[20] From the graph we see that

$$\lim_{x \rightarrow -2^+} f(x) = 2$$
$$\lim_{x \rightarrow -2^-} f(x) = 2.$$

Therefore the limit exists and

$$\lim_{x \rightarrow -2} f(x) = 2.$$

Notice that the actual value of the function at -2 is 3 i.e., $f(-2) = 3$. But the limiting value is 2 i.e., $\lim_{x \rightarrow -2} f(x) = 2$. Interesting! we will talk about this in continuity chapter.

[22] From the graph we see that

$$\lim_{x \rightarrow -1^+} f(x) = 0$$
$$\lim_{x \rightarrow -1^-} f(x) = 2.$$

Since $\lim_{x \rightarrow -1^+} f(x) \neq \lim_{x \rightarrow -1^-} f(x)$, therefore $\lim_{x \rightarrow -1} f(x)$ does not exist.

[29]

$$\lim_{x \rightarrow 3} \sqrt{x+1} = \sqrt{4} = 2.$$

[41] Notice that this is a $\frac{0}{0}$ case.

$$\begin{aligned}\lim_{x \rightarrow -1} \frac{x^2 - 1}{x + 1} &= \lim_{x \rightarrow -1} \frac{(x + 1)(x - 1)}{x + 1} \\ &= \lim_{x \rightarrow -1} (x - 1) = -2.\end{aligned}$$

[50] Notice that

$$|x - 2| = \begin{cases} (x - 2), & \text{if } x - 2 > 0 \\ -(x - 2), & \text{if } x - 2 < 0. \end{cases}$$

Therefore we have

$$\begin{aligned}\frac{|x - 2|}{x - 2} &= \begin{cases} \frac{(x-2)}{x-2}, & \text{if } x - 2 > 0 \\ \frac{-(x-2)}{x-2}, & \text{if } x - 2 < 0 \end{cases} \\ &= \begin{cases} 1, & \text{if } x > 2 \\ -1, & \text{if } x < 2. \end{cases}\end{aligned}$$

So the limits are following

$$\begin{aligned}\lim_{x \rightarrow 2^+} \frac{|x - 2|}{x - 2} &= 1 \\ \lim_{x \rightarrow 2^-} \frac{|x - 2|}{x - 2} &= -1.\end{aligned}$$

Since $\lim_{x \rightarrow 2^+} \frac{|x-2|}{x-2} \neq \lim_{x \rightarrow 2^-} \frac{|x-2|}{x-2}$, therefore $\lim_{x \rightarrow 2} \frac{|x-2|}{x-2}$ does not exist.

[51] Given

$$f(x) = \begin{cases} \frac{1}{3}x - 2, & \text{if } x \leq 3 \\ -2x + 5, & \text{if } x > 3. \end{cases}$$

It is easy to see that

$$\begin{aligned}\lim_{x \rightarrow 3^-} f(x) &= \frac{3}{3} - 2 = 1 - 2 = -1 \\ \lim_{x \rightarrow 3^+} f(x) &= -(2 \times 3) + 5 = -1.\end{aligned}$$

Therefore we have

$$\lim_{x \rightarrow 3} f(x) = -1.$$
